Autoimmune AA (AAA) versus autoantigen-independent non-autoimmune AA (NAIAA)

- One hair loss pattern, two main AA pathobiology pathways -

Autoimmune AA (AAA) versus autoantigen-independent non-autoimmune AA (NAIAA)

- One hair loss pattern, two main AA pathobiology pathways -

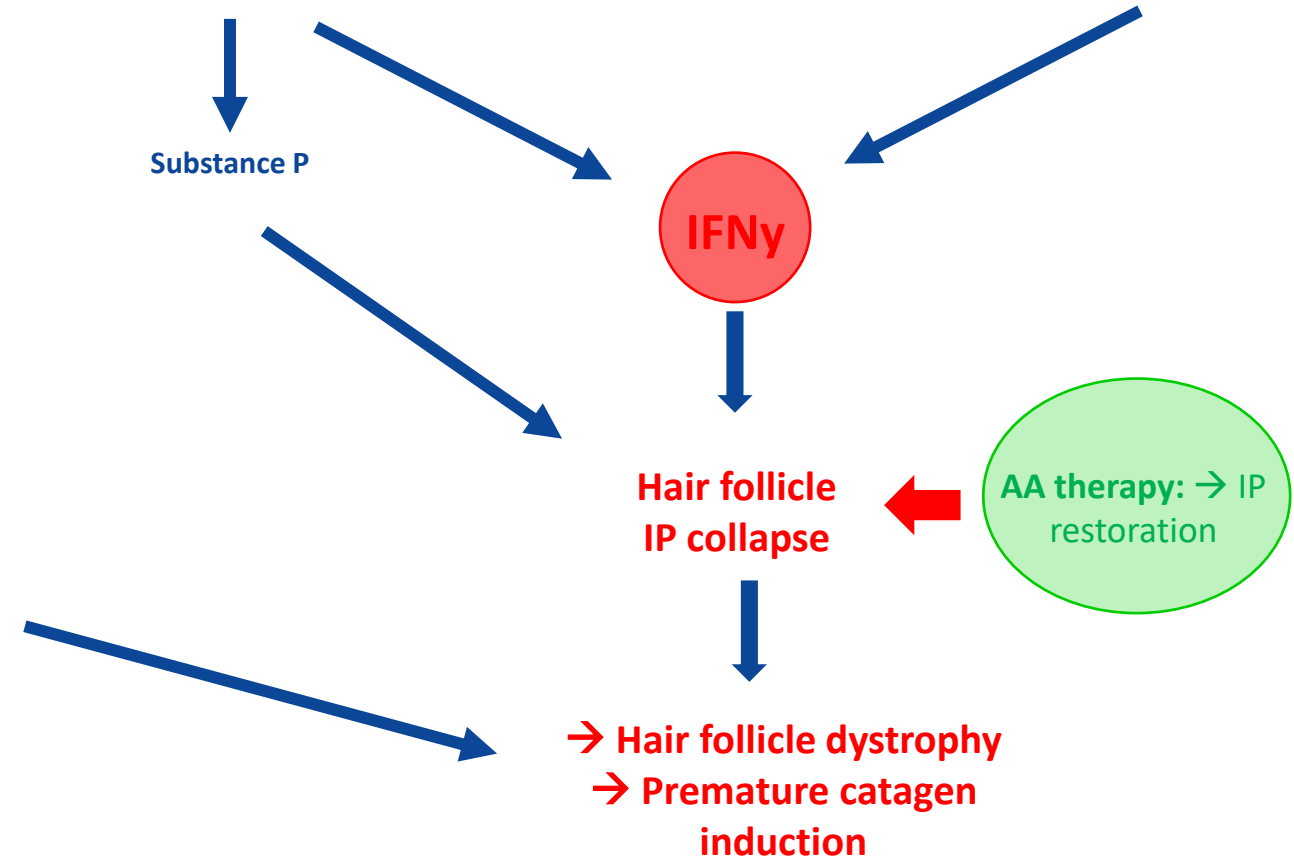

Non-autoimmune Alopecia Areata

- NK cell-, mast cell-, ILC-1- and/or γδ T cell- activity
- HF microbiome dysbiosis
- Neurogenic HF inflammation

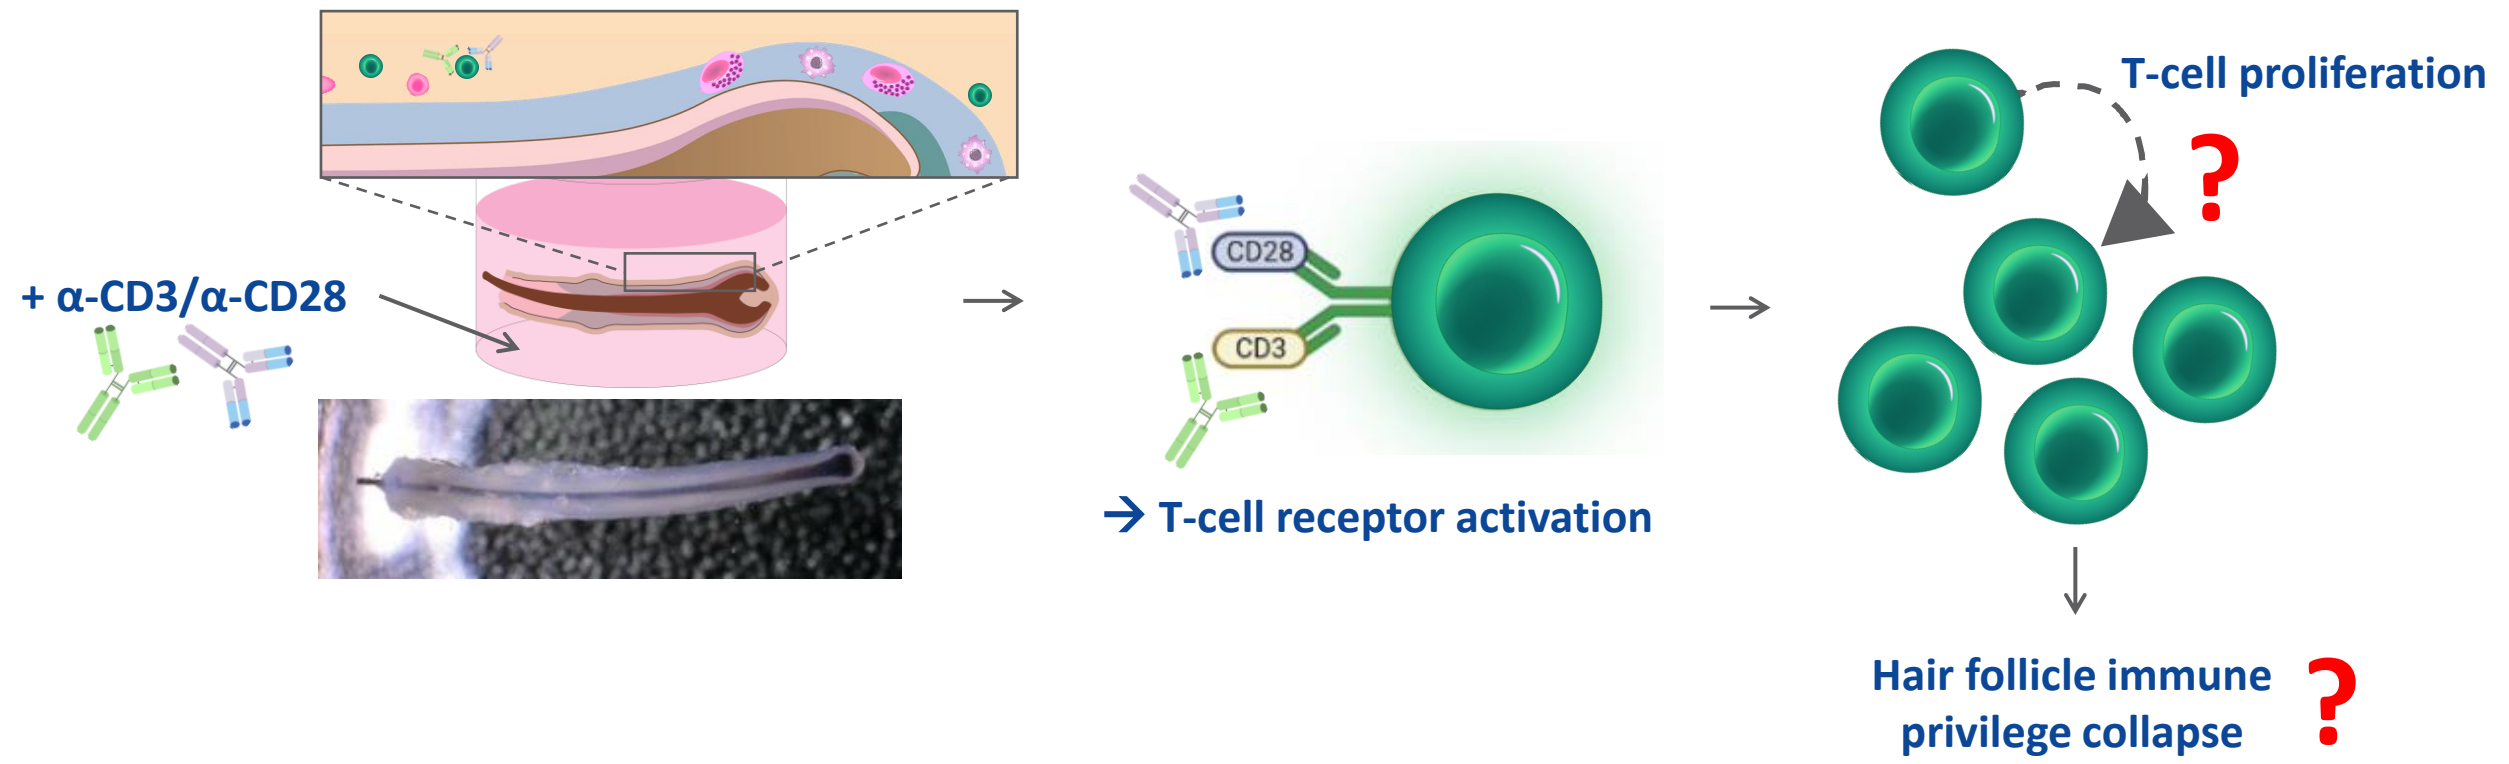

Autoimmune Alopecia Areata

- Ectopic expression of HF antigens
- CD8+ T-cell responsive to anagen HF-associated autoantigens
- Insufficient Treg activity

Is HF IP collapse induced by mimicking antigen-presentation in hair follicle organ culture?

Stimulating healthy human hair follicles *ex vivo* with α -CD3/ α -CD28 antibodies to induce T-cell proliferation and IP collapse associated markers

Treatment with α -CD3/ α -CD28 antibodies neither affects hair cycle nor hair matrix proliferation in healthy human HFs *ex vivo*

Hair cycle staging & Hair matrix keratinocyte proliferation

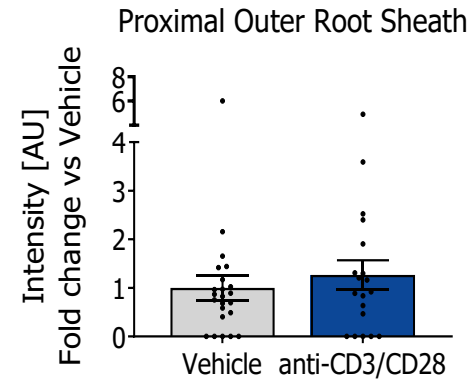

Treatment with α -CD3/ α -CD28 antibodies upregulates immune privilege collapse-associated markers in healthy human HFs *ex vivo*

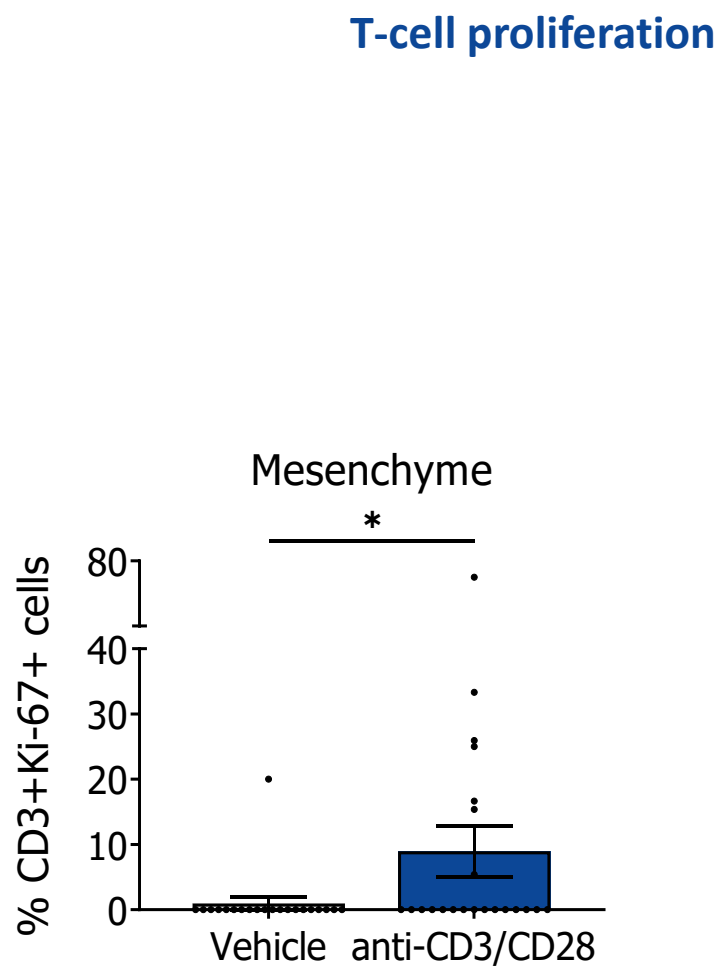

MHC class I expression

MHC class II expression

Treatment with α -CD3/ α -CD28 antibodies stimulates T-cell proliferation in healthy human HFs *ex vivo*

Treatment with α -CD3/ α -CD28 induces T-cell proliferation and IP collapse in human hair follicles ex vivo

Farudodstat, the highly selective DHODH inhibitor, that inhibits T-cell proliferation

farudodstat

- Dihydroorotate dehydrogenase (DHODH) is an ubiquitous enzyme located within the inner membrane of the mitochondria essential for the *de novo* production of pyrimidines, which is induced during cell proliferation
- DHODH inhibitors are currently used for the treatment of autoimmune disease, e.g. Teriflunomide in MS
- DHODH inhibitors preferentially block T-cell proliferation and, as consequence, cytokine production
- **Farudodstat** is a highly selective DHODH inhibitor with a well-tolerated safety profile *in vitro* and *in vivo*
- **Farudodstat** is approximately 30 times more potent (IC₅₀:35nM) than first-generation DHODH inhibitors in limiting T cell proliferation and IFN γ release
- **Farudodstat** is currently in a Phase 2a proof-of-concept trial for AA. FAST-AA is a 2:1 randomized trial, with 60 alopecia areata patients receiving oral doses of either farudodstat or placebo twice daily for 12 weeks, followed by a crossover treatment period

Can dihydroorotate dehydrogenase (DHODH) inhibition by farudodstat protect HFs *ex vivo* from the α -CD3/ α -CD28 induced IP collapse?

Farudodstat maintains anagen phase without impacting hair matrix keratinocyte proliferation or expression of IP collapse-associated markers in healthy HFs *ex vivo*

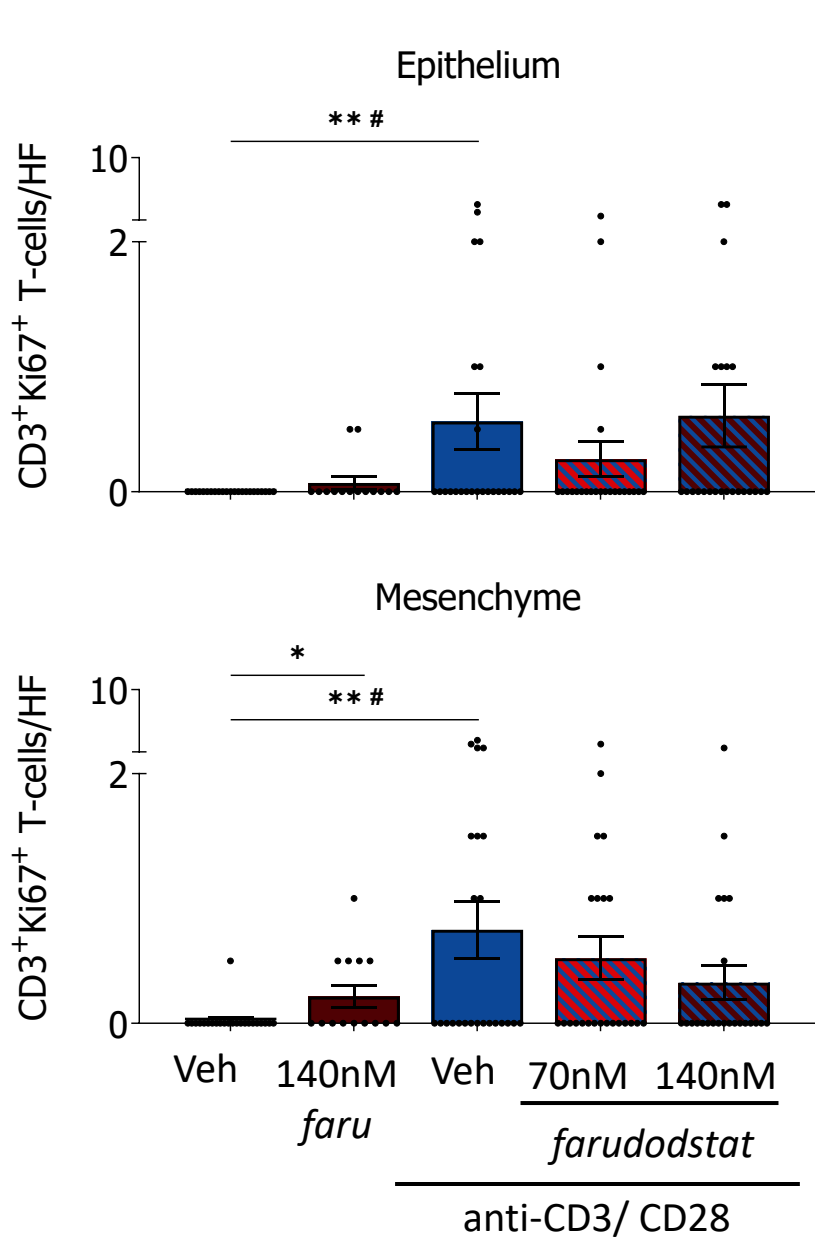

Hair cycle staging & Hair matrix keratinocyte proliferation

MHC class I expression

Farudodstat tendentially reduces α -CD3/ α -CD28 induced T-cell proliferation in HFs *ex vivo*

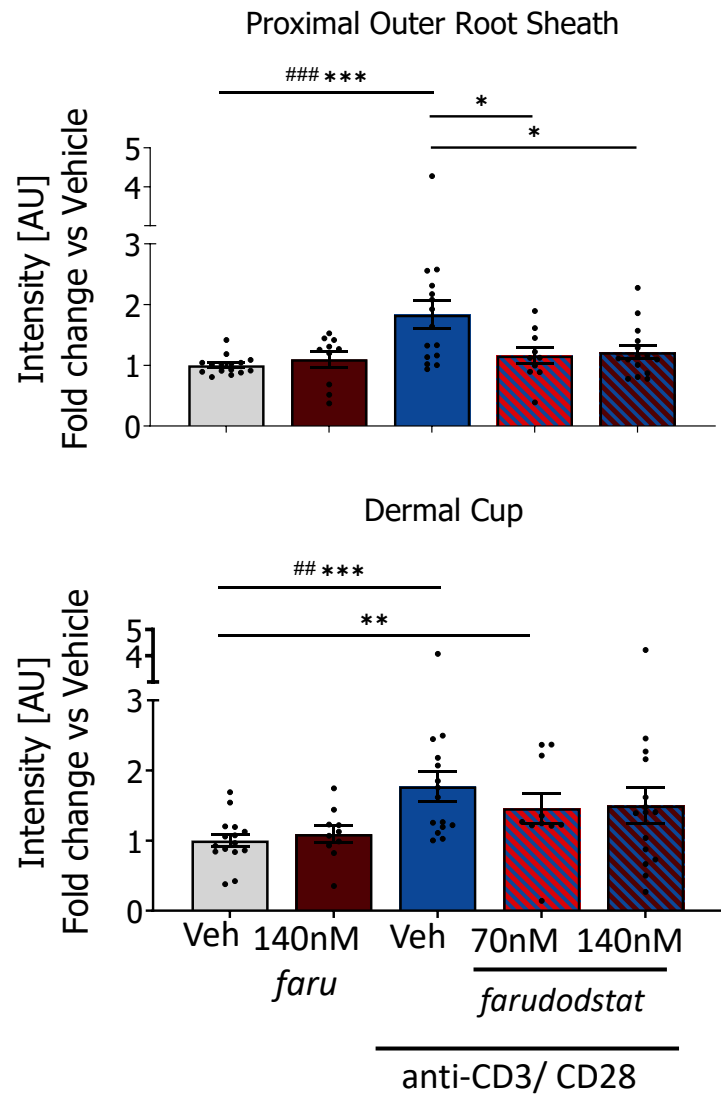

T-cell proliferation

n = 14-24 HFs from n = 2-3 donors. Data are presented as mean \pm SEM, treatment groups were compared using D'Agostino & Pearson omnibus normality test, no Gaussian distribution; Kruskal-Wallis test with Dunn's multiple comparison test #p<0.05; Mann-Whitney, *p<0.05, **p<0.01. DC: dermal cup, faru: farudodstat, gHM: germinative hair matrix, pORS: proximal outer root sheath, veh: vehicle

Farudodstat protects HFs *ex vivo* from α -CD3/ α -CD28 induced upregulation of MHC class I expression

anti-CD3/ CD28

70nM

farudodstat

140nM

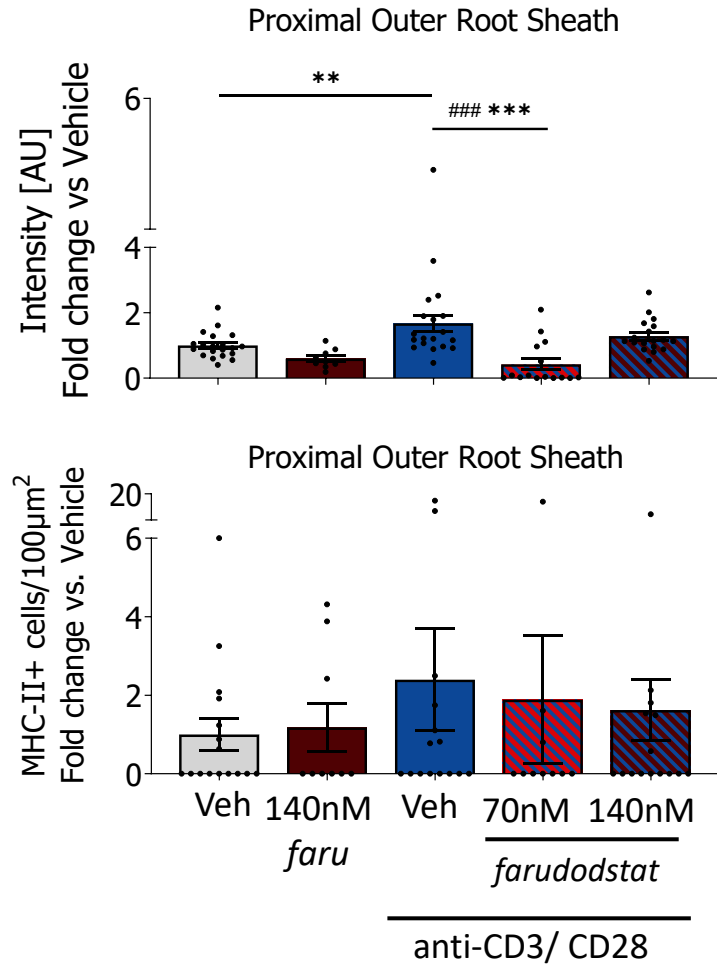

farudodstat

MHC class I DAPI

n = 9-15 HFs from n = 2-3 donors. Data are presented as mean \pm SEM, treatment groups were compared using D'Agostino & Pearson omnibus normality test, no Gaussian distribution; Kruskal-Wallis test with Dunn's multiple comparison test #p<0.05, ##p<0.05, ### p<0.001; Mann-Whitney, *p<0.05, **p<0.01, ***p<0.001 DC: dermal cup, faru: farudodstat, gHM: germinative hair matrix, pORS: proximal outer root sheath, veh: vehicle

Farudodstat reduces α -CD3/ α -CD28 induced upregulation of MHC class II+ cell number and expression

MHC class II

n = 9-16 HF from n = 2-3 donors. Data are presented as mean \pm SEM, treatment groups were compared using D'Agostino & Pearson omnibus normality test, no Gaussian distribution; Kruskal-Wallis test with Dunn's multiple comparison test, ### p<0.001 ## p<0.01, #p<0.05; Mann-Whitney, *p<0.05, **p<0.01, ***p<0.001. DP: dermal papilla, faru: farudodstat, pORS: proximal outer root sheath, veh: vehicle

Conclusion & Perspective

- TCR stimulation *ex vivo* is enough to induce hair follicle immune privilege collapse
- DHODH inhibition with *farudodstat* might offer a novel therapy for AA management (proof-of-concept study on study in AA patients ongoing)
- Our data invite for (pre)-clinical investigation of further read-out parameters in HFs under *farudodstat* treatment

farudodstat

T-cell proliferation

+ α -CD3/ α -CD28

Cytokine release
(e.g. IFN γ , IL-18,
...)

Hair follicle immune privilege protection

dWAT: dermal white adipose tissue; DC: dermal cup; gHM: germinative hair matrix, ORS: outer root sheath

- Other AA associated markers (e.g. MICA, CD1d, B2M,...)
- IP guardians? (e.g. α -MSH, TGF β 1/2,...)
- Cytokine and Chemokine release (e.g. IL-15, CXCL10, CXCL12,...)
- Cytotoxicity/HF dystrophy,...
- ...
